Remember kids, a working smoke alarm greatly increases your chances of getting out of a fire safely. Be sure to check and test your alarm twice a year!

Kids, remember that carbon monoxide is a gas that can’t be seen or smelled, but it’s very harmful to you and your family if it gets in your home. A carbon monoxide detector can warn you if there’s danger!

Kids, home sprinkler systems can tell when a room is on fire, and start spraying water on the flames. This helps to slow down or stop the fire before it can cause you and your family harm.

Hey Kids! We want you to teach your parents about some very important tools that can make your home a safer place!

1. Smoke Alarms!
A smoke alarm is a device that warns you if there is a fire. Often, a fire might happen while we sleep, and a smoke alarm will wake you up and let you know you need to get out of the house!

2. C.O. Detectors!
Carbon monoxide is a gas that you can’t see or smell. If it gets into our homes, it can be a danger to us. A C.O. detector can warn us if this is happening, and let us know we need to get outside into the fresh air fast!

3. Sprinkler Systems!
When a room gets hot from a fire, a home sprinkler system can feel this and shower the room with water. This can slow down the fire, or sometimes even put it out!
